

Illustration and Writing Contest-Now and Future: 2020 vs. 2030

The first part of the illustration shows that I think the inflation problem will be more serious in the future if people continue to over-demand some special commodities and make them in short supply, commodity prices rise, and triggering a chain reaction in other parts of the economy. Inflation will make the rich will be richer; the poor will be poorer, and it will also reduce the value of savings deposits.

The second part of the illustration explains the impact of global warming on the earth. When the sea level rise, which accelerates the melting of ice and leads to the loss of habitat. If we can reduce carbon emissions and make more use of renewable resources, we will slow down global warming.
