Impact what environmental issues and technical innovations brought are worth being discussed. In this image, global warming caused the melting of glaciers and climate change. Although the development of technical innovations contributed to a convenient life, it caused air pollution and kept people at distances, which made people communicate with phones even though face to face.

If people don't work out the solutions to these problems, there may be only two seasons that are summer and winter in the world after ten years. Because of extreme climate, animals can't live in their habitats and migrate to the zoos. In the future, robots accompanying people will be invented. It causes people to prefer staying home with robots to going out with friends, which keeps people at further distances.
